

FOR IMMEDIATE RELEASE

MTN Japan Deploys FutureDial NDSE™ Solution for Automating the Data-Clearing and Refurbishing of Used Networking Equipment for Resale

Simultaneous Data Erasure for Multiple Network Routers, Switches, and Other Network Equipment

TOKYO, JAPAN and SUNNYVALE, CA — JUNE 3, 2024 — [FutureDial Incorporated](#), the global leader in automation solutions for device processing, and Tokyo-based [Movable Trade Networks Inc. \(MTN\)](#), a major recycler of used office automation (OA) and IT-related equipment in Japan, are excited to announce MTN's adoption of FutureDial's innovative [Network Device Secure Eraser™ \(NDSE™\)](#) solution. This deployment at MTN's processing center will automate the data-clearing and refurbishment of preowned network routers, switches, and other network equipment, facilitating their resale in secondary markets.

The new partnership promises to further enhance MTN's ability to scale up to meet demand for networking equipment in the Japan Market.

Simultaneously Processes Multiple Network Equipment with One Workstation

Data security extends beyond computers and mobile devices; network routers, switches, and other equipment also store sensitive information that must be securely erased before disposal or reuse. Recognizing network security as a top priority, FutureDial's NDSE™ offers a robust solution for organizations focused on comprehensive data erasure. NDSE™ is designed to ensure ultimate data security by simultaneously erasing data from multiple routers, switches, and other network devices. Meeting both NIST and ADISA standards for data erasure, NDSE™ ensures the complete removal of sensitive data from preowned equipment. This portable solution can simultaneously process up to 40 devices per workstation in less time, making it scalable for businesses of any size.

Mr. Hiroyuki Arai, FutureDial's Representative Director for Japan, emphasizes the competitive edge that companies like MTN can gain through automation with NDSE™: "We are happy for MTN to be the first in Asia to deploy NDSE, which is a proven solution in the U.S. By this, the process will be automated, and the quality, cost and delivery will also be dramatically improved."

The cost advantages of using NDSE™ include:

- **Labor Savings:** Minimizes manual labor, reducing costs and increasing margins.
- **Increased Productivity:** Simultaneously processes up to 40 connected network equipment devices in less time, enhancing productivity and reducing cost per device.
- **Improved Accuracy:** Reduces human error and the need for rework, saving time and money.
- **Scalability:** Customizable software that scales with business growth, allowing more device processing without additional costs.
- **Enhanced Reputation:** Positions businesses as industry leaders, attracting more customers and increasing revenue.

Greater Capacity and Efficiency

MTN's Representative Director Mr. Masaaki Suzki highlighted the impact of the NDSE™ adoption and deployment: "We are very pleased to be the first company in Japan to introduce FutureDial's latest solution as their long-time partner. NDSE will bring major changes to MTN and the Japanese market. This not only enhances our operational efficiency but also ensures we meet the highest standards of data security, allowing us to deliver superior, secure refurbished products to our customers more swiftly than ever before."
